

FED

2014-11-26

QE is well covered in the media, but what is QE? By the way, this is not limited to the US dollar, but also the Japanese yen, and European banks. Abenomics is on par with US QE stimulus package, on the basis of exorbitance and a shaking of the underlying foundation which allows the governments to issue such QE policies.

The 3 players in the QE game are: 1) FED, 2) US government (military), 3) aristocrats.

- 1) **Aristocrats fund all nations**
- 2) **Aristocrats start wars**
- 3) **Aristocrats control corporations**
- 4) **Aristocrats control religion, media, education, military, politics, everything**
- 5) **Militaries protect aristocrats**
- 6) **Militaries protect aristocrats power to issue currency**
- 7) **FED is a central bank and all central banks owned by aristocrats**
- 8) **Aristocrats will combine all currencies into one, once they have ensured real power in all governments**

Some claim UK banks own US FED through crossholdings. Not too far fetched as US was once a British colony. We need to keep things in context of history. I like Pastor Tom Nelson from Denton Bible Church because he did a fantastic series on Christian history, which connects different movements in history in relation to one another. Keeps thing in perspective and can see a trend in all the chaos.

Beginnings

Why would the ordinary citizens trade and buy goods in US banknotes? Because the US government issued the banknotes and guaranteed the wholeness of the notes. The average Joe does not question the government. Also, if the US banknote is the only "legal" tender in a country, people will follow blindly. The member banks raised capital through their branch offices selling US banknotes to citizens in exchange for their gold. The gold was sent to Fort Knox for safe keeping. So, Fed is the distributor and gathers clients for US bank notes, in exchange for gold and security. The gold was used as collateral when US banks exchanged US dollar for foreign currency to buy foreign assets. Aristocrats controlled gold supply, gave out paper currency to the citizens and the US government. US government protected by foreign nations like Britain and France. US shipped goods to the foreign nations in return. Allowed them to settle in US in exchange. Received more gold. US currency stable and credible on its own, through the amassed gold supply. Aristocrats strengthened their grip of finances, business, trade in US. Then, in Dec. 23, 1913, FED established by Fed Reserve Act. Act signed by Woodrow Wilson, but drafted by Nelson Aldrich, whose daughter married the only son of John D. Rockefeller. Andrew Jackson, the US president, disassembled the 2nd Bank of the US, because it would give the monetary power to a small political elite. As a result of the Fed Act, US dollar was to be printed by FED.

Aristocrats

Aristocrats? You betcha. They still exist. Not only do they exist, but they own the US. US is their home. Not just citizenship, but everything in US is their property. They run everything in the US. They control government, education, banks, media. Everything.

Think of it this way. If you had \$100 trillion in your bank account and you live in USA, what wouldn't you control? You would buy up everything. Rig the system. Fire people, kill people off, do whatever you want to do. You are above the law. You can change the law. You are unstoppable. You can change the President. You can manipulate the market. You can start wars with any country.

The US government is broke. How can any entity finance road construction, bridges, utilities etc without financing from sponsors? Think of the Jerry Lewis campaign every New Year. Does that charity operate within its' own power? No, they need sponsors to contribute to finance their operations.

The US government is a charity case. It is not a for-profit operation. So, rich banks back in the 1700s paid for roads, bridges etc. in exchange for government seats and power to control the country. Fair enough. They bought the seats.

The US government back in 1700s had no credibility. It was a fledgling nation, with no army, power and wealth. So, they asked banks from overseas to finance their construction. Why did Benjamin Franklin go back and forth from France? To beg for money.

Why would the overseas banks take on a risky bet? They would only do it if the US government agreed to borrow from them, and if the aristocrats could control the currency. Also, they would get favorable treatment to take over the resources in the land. They would be the ones to build the bridges, the harbors, the companies.

So, the group of banks divided out the risk by making a group of banks form the FED. The FED would lend to the US government, in exchange to startup companies and corporate entities with no restrictions. Also, they would take over the US army to support the foreign banks' will.

The marginal billions in US dollar for interest are pences. It is nothing. Have to go beyond this and look at the historic background. What good is billions in paper money, if that government which supports the money goes bankrupt? Think of Zimbabwe or North Korea, who change the value of the paper money overnight. One could be holding a Billion dollars, but if the government changes the value system so that it is only worth 1,000, the paper becomes tissue paper. No value. So, a few billion in interest is not the main issue.

People cite the 6% dividend to the member banks, and the residual profits are returned to the US Treasury. So they brush off this notion saying the member banks don't really profit off the operation. People forget how much fixed income, especially US Treasury operations, generates in profits for banks. Also, the US Treasury will use that inflow to pay down the debt payable to the FED. So in essence, that money will trickle back to the FED, or the member banks. At the end of the day, the TRILLIONS in outstanding debt, will have to be repaid to the FED one day.

The US government issues bonds, or IOUs, and gives it to the FED. In exchange, the US government receives the FED printed banknotes, called the US dollar. The US government can use the FED banknotes to pay for bridges and etc, which is backed by the FED's deep pocket, or rather the aristocrats' deep pockets.

The FED which now holds a bunch of the US bonds can either hold onto it as an Accounts Receivable, or sell them off to other investors at a slight profit. If they choose to sell the bonds, there will be less cash circulating, which will increase the demand for cash, increasing the interest rate of banks. Another way to look at it is demand for bonds decrease, price of bonds go down, and the yield goes up.

If the FED buys back the bonds, there will be more cash circulating, which will lower interest rate. Another way to look at it is there is more demand for bonds, the price of bonds goes up, the yield will go down.

The FED controls the supply of cash, through their open market, or bond selling/trading operation. Since they have trillions of dollars in bonds, they can change the interest rates of mortgages, loans, savings since they are all benchmarked to the Treasuries. Is that coincidental? Nope. The member banks purposefully linked loans and etc to the Treasury rate so that everything in the system would be controlled by the FED.

Why did the US government borrow so much? Wars. War bonds, war financing, etc. WW1, WW2 started in Europe, where the aristocrats control banks, thereby the nations. Wars erupt, governments borrow billions from central banks, or member banks, and since the aristocrats have their fingers in every bowl, doesn't matter who wins. They eventually are net profit, and they now have billions in payables. Interest rates are at all time post war, ravaged nations can't repay interest so they run a deficit, interest compounds, and the debt balloons over time. Nations are crippled before the central banks, the member banks, the aristocrats.

We have seen this in Egypt where famines came, citizens sold off goods, cattles and eventually lands. They finally became indentured slaves to the nation. This happened to the Israelites. This is why God allowed Jubilee, where after 50 years the land were to be returned to the rightful owners. Also, God didn't want usury, or excessive interest. But the aristocrats ignore these 2 financial tenets and intentionally enslave the people for generations.

The big picture is there are those who control the physical assets of a nation, who are behind the FED and the ECB and Abenomics. The large global banks, and even the IMF, who is the 4th largest gold holder, are the big players.

Local banks, banks originating from weak countries are nothing. The only banks that matter are the banks which control power in the strong, militarized nations. Chase, Wells Fargo, BofA in US, the 4 big banks in China, Barclays, Deutsche Bank, HSBC in Europe.

These banks control the military operation of the strong nations. Who are the constituents? The lay people? The billions of people? No. They don't mean squat. It is a charade. Behind the scenes, the aristocats control the banks, and thereby, control the nations. Does this sound far fetched? A minority controlling the masses.

Consider a company. Executives get paid \$350 for every \$1 an employee takes home. Yet, the employees spend 10+ hour days in

their chicken coop offices, day in and day out, risking family and health, to generate an additional dollar, while executives use the corporate card to wine and dine client executives, who also spend all their day in 1 or 2 meetings, and eat and drink the rest of the day. This is human nature. This is reality in 2014 and really, for all human history.

One way to eliminate their power is to do away with currencies, and etc. US dollar was a conduit to control actual power over a nation. Euro proved people don't have to restrict denomination to a certain country. Should the Roman empire still exist today, all of Europe and N. Africa would use 1 currency. So, they seek to remove all denomination and use just one. Whoever controls that one currency controls all the regional governments, as seen by the FED/US, ECB/Europe, BOJ/Japan. The craving for US dollar is reminiscent of the Opium craze. People were addicted to opium, and likewise, people are crazy for the dollar.

Global mainstream media is used to unify people, breakdown barriers. Why is Lady Gaga popular in China/Korea? It is all under the blessing of the aristocrats. Not purely similar musical taste. It is an enforced agenda.

- US government pays interest to FED
- US government was essentially bought out by FED, to protect the FED's banknotes
- The US banknotes have value because the member banks can finance the banknotes through the foreign branches, when it first started
- Now, the US can protect their banknotes domestically because the US government can defend, in the physical sense through their army, the value of the US banknote
- Without ammunition, the FED banknotes are worthless
- The US government ensures the value of the FED banknotes
- The FED is a central bank, which is controlled by member banks
- Member banks own other central banks globally
- The banks make their own currency and have the power to generate more cash
- They replaced gold standard to remove any limitation to their wealth generator
- Kings, queens, presidents don't control governments; Banks control governments
- Rich, aristocratic families control banks, and in 21st century, there is no border; it is a global bank
- Question is, with an excess of cash through QE stimulus packages, won't the value of the cash diminish if trillions of cash is generated?
- We need to understand the background to understand what is happening with Abenomics/QE
- The US government has trillions in US bonds, which is debt, and is owned by China and other foreign nations, but mainly owned by the FED
- FED gives US government FED banknotes in exchange for a payable
- US government pays interest annually to FED
- FED receives IOU from US government in the form of bonds
- FED can control the interest rate by selling the IOU to the capital market, or buying from capital market

Where would newly founded governments get funding, except from nobility?

Nobility funds the new government, in exchange for protection from army and protection of assets

Nobility owns the country, through the puppet government

If nobility can generate the currency and control the currency, then they can make wealth out of thin air

This is the ultimate goal of any institution or country

The Fed lends money to the US govt. The debt is on the US govt books.

Where does FED get money to lend to the US? If you take a look at a US dollar, you will see the "Federal Reserve Note" on the front of the paper. The FED is backed by the member banks and has been since the founding. The member banks lent money to the Fed, which lent money to the US government when it was first founded.

Is it any surprise that most of the US government debt trading is handled by the large, member banks, which by the way is not regulated by the SEC?

The US government mint prints the dollars, and the dollars are distributed by the FED member banks. Essentially, the US citizens are fronting the bill for the US government. So, all the labor and goods are traded in US dollar by the US people, who use the US dollar distributed by the FED bank, who received the dollar from the US mint.

How did the US government secure the payable? First, it was a gold backed currency, but it changed to fiat currency when the gold standard was replaced. So, back when the FED first lent money to the small US government, it was secured by the gold held by the US government. The US government raised capital from taxes and etc. The surplus went to purchase gold and other assets such

as land.

But now, the US government has trillions of dollars of debt, in the form of US notes, but they aren't holding trillions in gold. So, what is the value of US dollar? The trust of people. This trust however is being diminished as China and Russia are co-operating in shifting the global reserve currency from US dollar to Chinese yuan.

Getting off the gold standard has allowed the global economy to grow exponentially. Should we have stayed on a gold standard, growth would have been much more stunted and the innovations and companies we see today may not have existed without the additional financial capital being invested into the new ventures.
